ET200S TECHNOLOGICAL FUNCTIONS — 1COUNT

Part 1: ET200S process module 1Count24V/100kHz

1. Overview

ET200S process module is mainly in 4 types: 1Count24V/100kHz, 1Count5V/500kHz, 1SSI and 2PULSE. This paper uses a simple debugging routine to describe how to set the functional applications of ET200S process module 1Count24V/100kHz according to the process requirements, as well as its related software and hardware for application, operation and test.

The process module 1Count24V/100kHz has the following main Operating modes:

- 1) Count mode: including Continuous counting, Cyclic counting and Single counting
- 2) Measurement mode: including frequency measuring, cyclic measurement and speed measuring
- 3) Position detection: this mode is a part of the continuous counting function and is used as a pure input module in Isochrone mode.

This paper mainly describes application of this module in Count mode, and the other modes such as Measurement mode, may be used by reference to the count function.

2. Hardware architecture of system

Fig. 1: Hardware Architecture of system

In this example, a S7-300 PLC reads the count data from 24V incremental encoder through ET200S module 1Count24V/100kHz and monitors the rotation state.

Shown in Fig. 1 is configuration of the sample system, which includes the following hardware:

- one laptop or PG/PC
- one CP5512
- one S7-300 PLC
- one ET200S system

3. Hardware and software demands

Table 3-1: Ordering information for hardware

Name	Quantity	Order number
IM151-1 STANDARD interface module and terminating module	1	6ES7151-1AA03-0AB0
TM-P15S23-A0 (screw-type terminal)	1	6ES7193-4CD20-0AA0
TM-E15S26-A1 (screw-type terminal)	1	6ES7193-4CA40-0AA0
PM-E 24-48 VDC/24-230 VAC	1	6ES7138-4CB10-0AB0
1 SSI, 1 unit	1	6ES7 138-4DB01-0AB0
1Count24V/100kHz, 1 unit	1	6ES7 138-4DB01-0AB0
PROFIBUS FC Standard Cable		6XV1 830-0EH10
PROFIBUS FastConnect bus connector RS 485 with 90° cable outlet (with PG interface)	2	6ES7 972-0BB50-0XA0
CP 5512 communications processor	1	6GK1 551-2AA00
MPI cable For connecting SIMATIC S7 and the PG through MPI; length 5 m	1	6ES7 901-0BF00-0AA0
CPU 315-2 DP	1	6ES7315-2AG10-0AB0

Table 3-2: Ordering information for software

Name	Order number
STEP 7 Professional Edition 2004	6ES7 810-5CC08-0YA5

4. Installation and wiring of hardware

- 1) 24V pulse generator (without direction signal)
- 2) 24V pulse generator (with direction signal)
- 3) 24V incremental encoder

Fig. 2: Connection of encoder

5. System configuration and parameter setting

1) Hardware configuration

Connection shall be made according to Fig. 1: Hardware configuration diagram. One S7-300 PLC shall work as DP master to connect ET200S slave system, and the 24V incremental encoder shall be connected to ET200 1module Count24V/100kHz respectively according to Fig. 2: Wiring diagram.

2) System configuration and parameter setting

Build a new project with the name Latch_ET200S_1COUNT in STEP7 manager, insert one SIMATIC 300 STATION and name it 1COUNT. Then insert the rack, CPU, ET200S standard slave module and ET200S 1COUNT Counting module (selecting 1COUNT 24V/100kHz C module from the hardware list) successively according to the order numbers and hardware installation sequence.

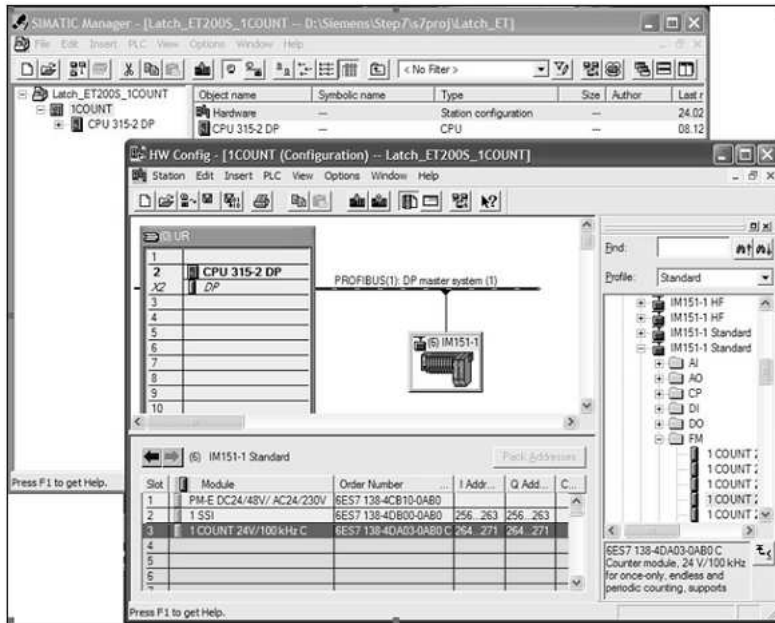

Fig. 3: Hardware configuration of master

The parameter configuration of ET200S 1COUNT module is seen in Fig. 4.

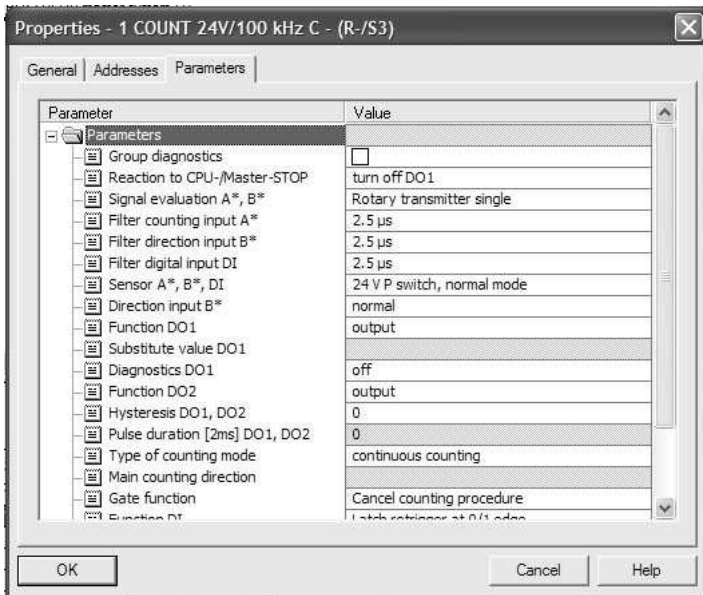

Fig. 4: Parameter configuration

The parameters Signal evaluation A* B* and Sensor A* B* DI shall be selected according to the connected encoder type, and FNP-type 24V incremental encoder is selected here.

The parameter Direction input B* may be set in positive or negative direction.

The parameter "Type of counting mode" may be set as 3 Count modes: Continuous counting, Cyclic counting and Single counting.

The other parameters may be set by selecting the default values.

3) Routine

Loop program OB1:

```
//Preset
L 0 // delete control bit
T DB1,DBD 0
```

```
T DB1.DBD 4
SET
S DB1.DBX4.0 //open software gate
```

```
//write control interface
L DB1.DBD 0 //write 8 digits into 1SSI module
T PQD 264
L DB1.DBD 4 //output start address
T PQD 268
```

```
//read feedback interface
L PID 264 //read 8 digits from 1SSI module
T DB1.DBD 8
L PID 268 //input start address
T DB1.DBD 12
```

As shown in Fig. 5, the parameter assignment of the control interface in hardware configuration matches the 8 bytes (PQB264 - PQB271) in output area of the count module. In the above-stated routine, the 8 bytes (DB1.DBB0 to DB1.DBB7) in DB1 are used to deposit parameters of the control interface.

Byte 4	EXTF_ACK CTRL_DO2 SET_DO2 CTRL_DO1 SET_DO1 RES_STS CTRL_SYN SW_GATE	Bit 7: Diagnostic error acknowledgment Bit 6: Enable DO2 Bit 5: DO2 control bit Bit 4: Enable DO1 Bit 3: DO1 control bit Bit 2: Start resetting of status bit Bit 1: Enable synchronization Bit 0: SW gate control bit
Byte 5	C_DOPARAM CMP_VAL2 CMP_VAL1 LOAD_PREPARE LOAD_VAL	Bit 7: Reserve = 0 Bit 6: Reserve = 0 Bit 5: Reserve = 0 Bit 4: Change function and behavior of DO1, DO2 Bit 3: Load comparison value 2 Bit 2: Load comparison value 1 Bit 1: Load counter (preparatory) Bit 0: Load counter (direct)
Bytes 6 to 7		Reserve = 0 ¹⁾

Fig. 5: Parameter assignment of control interface

As shown in Fig. 6, the parameter assignment of the feedback interface in hardware configuration matches the 8 bytes (PIB264 - PIB271) in input area of the count module. In the above-stated routine, the 8 bytes (DB1.DBB8 to DB1.DBB15) in DB1 are used to deposit parameters of the feedback interface.

Address	Assignment	Designation
Bytes 0 to 3	Count value or stored count value in the case of the latch function at the digital input	
Byte 4	Bit 7: Short circuit of the sensor supply Bit 6: Short circuit / wire break / overtemperature Bit 5: Parameter assignment error Bit 4: Reserve = 0 Bit 3: Reserve = 0 Bit 2: Resetting of status bit active Bit 1: Load function error Bit 0: Load function active	ERR_24V ERR_DO1 ERR_PARA RES_STS_A ERR_LOAD STS_LOAD
Byte 5	Bit 7: Down direction status Bit 6: Up direction status Bit 5: Reserve = 0 Bit 4: DO2 status Bit 3: DO1 status Bit 2: Reserve = 0 Bit 1: DI status Bit 0: Internal gate status	STS_C_DN STS_C_UP STS_DO2 STS_DO1 STS_DI STS_GATE
Byte 6	Bit 7: Zero-crossing in the count range when counting without a main counting direction Bit 6: Lower count limit Bit 5: Upper count limit Bit 4: Comparator 2 status Bit 3: Comparator 1 status Bit 2: Reserve = 0 Bit 1: Reserve = 0 Bit 0: Synchronization status	STS_ND STS_UFLW STS_OFLW STS_CMP2 STS_CMP1 STS_SYN

Fig. 6: Distribution of feedback interface parameters

6. Test, monitoring and diagnosis

Address	Symbol	Display format	Status value	Modify value
1	DB1.DBD 8	DEC	L#4248	
2	DB1.DBX 13.0	BOOL	true	
3	DB1.DBB 12	BIN	2#0000_0000	
4	DB1.DBB 13	BIN	2#0100_0001	
5	DB1.DBX 4.0	BOOL	true	
6	DB1.DBD 0	DEC	L#2000	
7	DB1.DBX 13.6	BOOL	true	
8	DB1.DBX 13.7	BOOL	false	
9				

Fig. 7: Variable table monitoring

Establish a Variable table in STEP7 manager Blocks to monitor the measured encoder value in the variable DB1.DBD 8 (feedback interface Bytes 0 to 3), and monitor the encoder value change direction through variables DB1.DBX 13.6 (STS_C_UP) and DB1.DBX 13.7 (STS_C_DN).

7. Functions

7.1 Control of count input

Control through software gate
Software gate and Hardware gate ("and" logic operation)

7.2 Gating function

Software gate: control through user program
When enabling control bit of the software gate, use "interrupt counting procedure" in the parameter configuration and start counting from the load value. When enabling after the software gate stops, restart counting from the count value when counting stops.
Use "terminate counting procedure" in the parameter configuration and start counting from the load value. When enabling after the software gate stops, restart counting from the load value.

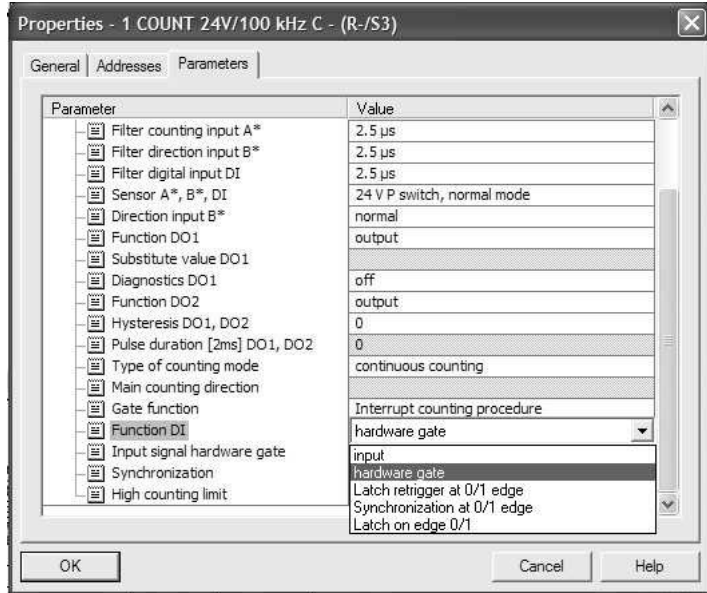

Fig. 8: Use of Hardware gate

Hardware gate: after the Hardware gate is enabled, it controls through digital input, and its function is the same as software gate control. The precondition is that "hardware gate" is set in the parameter "Function DI" as shown in Fig. 8.

7.3 latch function

Latch and retrigger:

After enabling "latch and retrigger" in parameter configuration "Function DI" of the hardware configuration, enable the software gate in the user program. When the digital input terminal has a rising edge pulse, latch the current count value. Proceed the count function till the digital input terminal has the next rising edge pulse, and latch the current count value and start recounting from the load value.

If the load value is loaded directly in this process, the latch value in the feedback word will not be changed. Closing the software gate will only interrupt counting, but the latch and retrigger functions in digital input will still work well. After the software gate is enabled, it shall be cautious that the count mode will start when the digital input terminal has the first rising edge. Refer to Fig. 9: Timing diagram of latch and retrigger functions.

Fig. 9: Timing diagram of latch and retrigger functions

Latch:
After enabling "latch" in parameter configuration "Function DI" of the hardware configuration, enable the software gate in the user program. When the digital input terminal has a rising edge pulse, latch the current count value. Proceed the count function till the digital input terminal has the next rising edge pulse, and latch the new count value.
If the load value is loaded directly in this process, the latch value in the feedback word will not be changed. Closing the software gate will only interrupt counting, but the latch function in digital input will still work well.

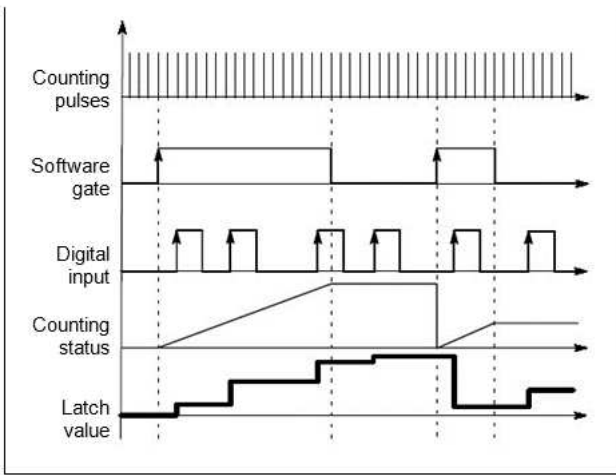

Fig. 10: Timing diagram for latching function

7.4 Synchronizing function

The synchronizing function may only be used in Single counting and Cyclic counting modes, for which the zero flag bit of the rotary encoder may work as the reference signal. Enable the software gate firstly and then the sync control bit. In Single counting synchronization, start synchronizing count of the load value from the first rising edge pulse in the digital input. In synchronizing of Cyclic counting, the first rising edge pulse in the digital input and each succeeding rising edge pulse will make the counter to start synchronizing count from the load value. After synchronizing completes, status bit "STS_SYN" will be set.

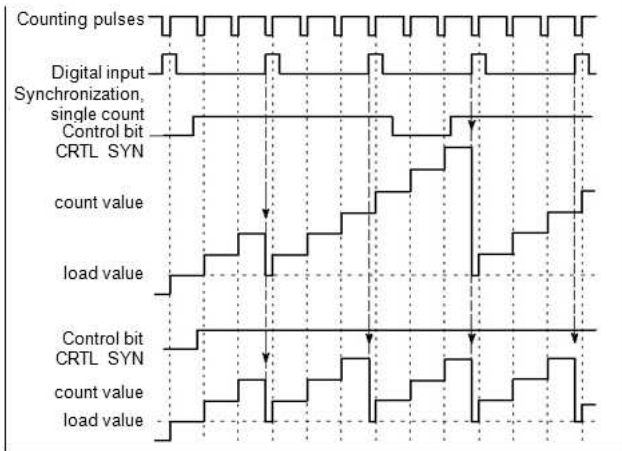

Fig. 11: Timing diagram for synchronizing function

7.5 Output control in count mode

The Counting module has one digital output and one virtual digital output (at status bit of the feedback interface) that may be used to save 2 comparison values, and the output may be controlled based on the relation between these two comparison values:

(1) Direct output control

Enable the control bits CTRL_DO1 and CTRL_DO2, and keep control over the output through control bits SET_DO1 and SET_DO2. The status bits STS_CMP1 and STS_CMP2 display the related output status. These status bits will maintain the current status until they are confirmed. If DO1 and DO2 are not enabled, these status bits may be impacted directly through control bits SET_DO1 and SET_DO2.

The following 4 output forms are similar to direct control output in application, for which the comparison value shall be loaded firstly and the output shall be controlled according to the comparison conditions.

(2) count value >= comparison value

Example: set a comparison value 2000, and enable DO1 output when the count value is larger than or equal to 2000.

Hardware configuration:

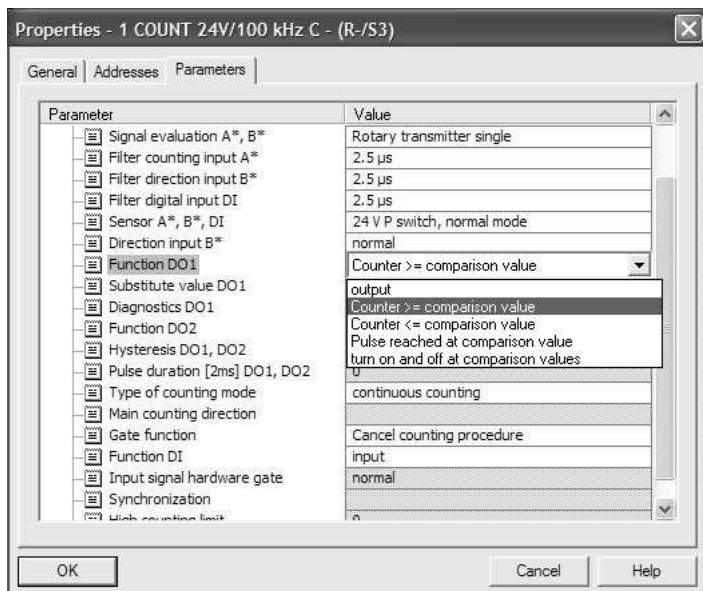

Fig. 12: Comparison value output

The parameter setting of the Counting module is shown in Fig. 12, in which it is only necessary to set "Function DI" as "Counter=>comparison value" and other other parameters shall be set by reference to Fig. 4: Common Count mode.

Main routine:

```
//Preset
SET
S DB1.DBX 4.0 // set software gate
S DB1.DBX 4.4 // enable D01

// load comparison value
A M 100.0 //trigger bit
S DB1.DBX 5.2
L DB1.DBD 4
T PQD 268

L 2000
T DB1.DBD 0
T PQD 264

AN M 100.0
R DB1.DBX 5.2
L DB1.DBD 4
T PQD 268

//write control interface
L DB1.DBD 0 //write 8 digits into 1SSI module
T PQD 264
L DB1.DBD 4 //output start address
T PQD 268

// read feedback interface
L PID 264 // read 8 bytes from 1SSI module
T DB1.DBD 8
L PID 268 //input start address
T DB1.DBD 12
```

Monitor and test: load comparison 1(2000) by enabling M100.0. When the count value of the encoder is larger than or equal to 2000, enable output D01, and set the status bits STS_CMP1 (DB1.DBX14.3) and STS_DO1 (DB1.DBX13.3) at the same time.

Address	Symbol	Display format	Status value	Modify value
1	DB1.DBD 8	DEC	L#1678	
2	DB1.DBB 12	BIN	2#0000_0000	
3	DB1.DBB 13	BIN	2#0100_0001	
4	DB1.DBX 4.0	BOOL	true	
5	DB1.DBD 0	DEC	L#2000	
6	DB1.DBX 13.0	BOOL	true	
7	DB1.DBX 13.3	BOOL	false	
8	DB1.DBX 13.6	BOOL	true	
9	DB1.DBX 13.7	BOOL	false	
10	DB1.DBX 14.3	BOOL	false	
11	DB1.DBX 4.2	BOOL	false	
12	M 100.0	BOOL	false	

Fig. 13: Comparison value < 2000

Address	Symbol	Display format	Status value	Modify value
1	DB1.DBD 8	DEC	L#2332	
2	DB1.DBB 12	BIN	2#0000_0000	
3	DB1.DBB 13	BIN	2#0100_1001

Fig. 14: Comparison value >= 2000

- (3) count value <= comparison
- (4) output pulse when reaching the comparison value
- (5) switch output (only for D01) when reaching the comparison value

Part 2: ET200S process module 1Count5V/500kHz

Please refer to Part 1 for application of the process module 1Count5V/500kHz. Its difference is mainly in hardware wiring and the parameter setting in hardware configuration.

1. Hardware wiring diagram

The module may only be connected to 5V incremental encoder.

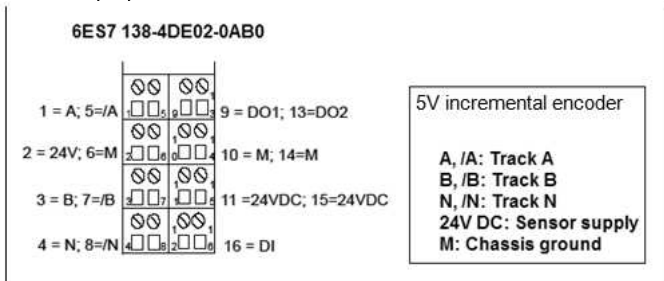

Fig. 15: Hardware wiring diagram

2. Hardware configuration and parameter configuration

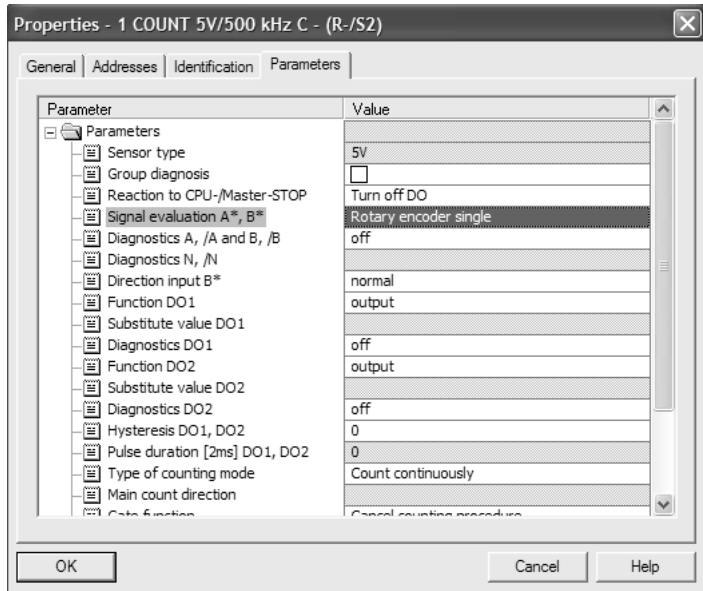

Fig. 16: Parameter configuration for module 1Count5V/500kHz

The parameters Signal evaluation A* B* and Sensor A* B* DI shall be selected according to the connected encoder type, and 5V incremental encoder Single counting is selected here.

The parameter Direction input B* may be set in positive or negative direction.

The parameter "Type of counting mode" may be set as 3 Count modes: Continuous counting, Cyclic counting and Single counting.

The other parameters may be set by selecting the default values.
